

I have a vacuum with a 2.5" hose. How do I connect this to the 2" port on the top of the Dust Deputy?

Most vacuums made by Sears (Craftsman), Rigid, Shop-Vac and others have a hose that is often called 2.5" diameter. This hose is usually 2.5" OD on the hose itself. The hoses usually have a harder plastic end cuff that measures 2.25" on the end that would normally get plugged into something (floor wand etc).

The hard end cuff on these 2.5" hoses does not fit well onto the 2" OD outlet of the Dust Deputy. They are generally loose and do not seal or stay securely attached.

Oneida offers a solution to this connection problem. The solution is two pieces which together allow a secure and well sealed connection from your vac hose to the Dust Deputy.

First attach the gray hose cuff (part number AXD200225) to the top of the dust deputy with the flanged (widest part) down.

Note that this part has a slight ridge on the inner wall which sometimes makes it hard to get started onto the 2" outlet pipe. If it is hard to get started, immerse the cuff in hot water for a minute to soften the cuff, then attach it to the 2" outlet pipe. This gray cuff has a 2.25" OD.

Then attach the black, rigid plastic connector (part number AXD225225) onto the gray cuff.

Purchase the following parts to make this connection:

You can now insert the end of your 2.5" hose (2.25" OD hose cuff) into the connector providing a secure connection to your Dust Deputy.

AXD200225
